VoiceLive 3 Firmware Updates

Versions

- 2.3.07 build 379
- 2.2.00 build 366
- 2.1.01 build 355
- 2.1.00 build 350

Details

Release Date: Feb 13, 2016 - 01:21 AM

Added Tracks/USB NaturalPlay option (VL3 has USB only) to allow isolation of digital audio from other potential NaturalPlay sources. This can be applied both globally and per-preset. In practice, you can decide whether a specific preset follows backing tracks (or incoming USB audio) instead of something else you normally use, like guitar.

Added Preset UP/DN to the Switch 3/6 options.

Fixed an issue where whistling into the unit could cause unrecoverable audio corruption. Please note: Harmony, Doubling, HardTune, Synth and some uMod effects are NOT compatible or intended for whistling and will cause other artifacts in the audio. That behavior is not a bug, but simply outside of the frequency capabilities of those effects.

Fixed an issue that could cause incorrect recall of momentary/latched mode settings for Switch 3/6.

Fixed an issue that could "forget" reverb/delay levels when controlling Reverb/Delay level via expression pedal.

2.2.00 build 366
2.1.01 build 355
2.1.00 build 350
Details
Release Date: Sep 02, 2017 - 12:12 AM
New looper feature!
AudioCue lets you arm a loop to begin recording with your input.
Select a volume threshold in the "Looper" menu, arm a loop track
for recording, and cue recording the loop when your input is louder
than the chosen threshold. When a loop is armed, you can press
another loop footswitch to cancel. You can also choose whether
AudioCue applies to every loop, or just your first loop!
(AudioCue settings are saved with the loop slot, not the preset)
Remastered metronome sounds, improved the behavior logic, and
metronome mute/enable is available as a Switch-3/6 target.
DSP improvements to the synth/vocoder.
Added notifications to inform you when the looper is active.
Handful of bug fixes including: missing pop-up messages, loop trigger
settings, external loop control, and overnight MIDI timeout.
